Biology Standard level Paper 2

Wednesday 11 May 2022 (afternoon)

Candidate session number												
	late ses	late session nu	late session number									

Instructions to candidates

1 hour 15 minutes

- Write your session number in the boxes above.
- Do not open this examination paper until instructed to do so.
- Section A: answer all questions.
- Section B: answer one question.
- · Answers must be written within the answer boxes provided.
- A calculator is required for this paper.
- The maximum mark for this examination paper is [50 marks].

2222-6017 © International Baccalaureate Organization 2022

Section A

Answer all questions. Answers must be written within the answer boxes provided.

There is growing evidence of a decrease in bee populations. This decrease is a serious problem because of their valuable role as pollinators in the ecosystems where they live. Neonicotinoid pesticides have been implicated in this decrease because they have been found at trace levels in the nectar and pollen of crop plants and in the bee colonies.

Scientists placed colonies of a species of bumblebee, *Bombus terrestris*, in the laboratory to test the effects of different levels of a neonicotinoid on their development. They divided the colonies into three groups:

- The control colonies were given a solution of water and sugar that resembled nectar produced by flowers.
- A second group of colonies was given the same sugar solution containing a neonicotinoid dissolved in it at low concentrations, similar to those found in nature.
- A third group of colonies was given the same sugar solution containing a neonicotinoid dissolved in it at high concentrations, similar to those found in nature.

After two weeks, all colonies were placed in the field to allow the bumblebees to feed naturally.

	Question	1	continued)
--	----------	---	------------

The mass of the colonies, including adult bumblebees, wax, honey and larvae, was recorded every week. The cumulative increase in mass was calculated and is shown on the graph.

[Source: adapted from Whitehorn, P.R., O'Connor, S., Wackers, F.L. and Goulson, D., 2012. Bumble Bee Colony Growth and Queen Production. *Science*, [e-journal] 336(6079), pp. 351–352. http://dx.doi.org/10.1126/science.1215025. REFERENCE REDACTED].

(ii)	State the cumulative increase in the mass of control colonies at 7 weeks.	
5.55 to 1.55		
		_

Compare and contrast the cumulative increase in mass of the three groups of

colonies once they were placed in the field.											
THE RESERVE OF STREET STREET,											

[3]

(Question 1 continued)

(iv) Suggest a reason for the changes in mass in the colonies between weeks 6 and 8. [1]

The number of queen bumblebees produced in each colony was recorded. New bumblebee colonies are started by a queen.

[Source: adapted from Whitehorn, P.R., O'Connor, S., Wackers, F.L. and Goulson, D., 2012. Bumble Bee Colony Growth and Queen Production. *Science*, [e-journal] 336(6079), pp. 351–352. http://dx.doi.org/10.1126/science.1215025. REFERENCE REDACTED].

(b) Using the data in the graph, predict how the use of neonicotinoid pesticides will affect bumblebee populations.

Section B

Answer one question. Up to one additional mark is available for the construction of your answer. Answers must be written within the answer boxes provided.

- People with the inherited disease hemophilia have a deficiency in one of the proteins that act as clotting factors in blood.
 - Outline how a protein is made in a cell by the process of translation.

[5]

A family has a history of hemophilia that is caused by a sex-linked recessive allele. A woman from this family is a carrier and marries a man who does not have the allele. Showing your working, determine the probability of their children having the disease.

- Explain how blood clotting occurs and the consequence for a person who has hemophilia. [7]
- The growing human population has an increasing demand for energy derived from crop plants. At the same time, increasing droughts that are part of climate change make it difficult to grow crops in some parts of the world.
 - Outline energy flow through a community in a natural ecosystem.

[5]

[3]

Explain how natural selection can cause traits such as drought resistance to develop in wild plants.

[7]

Suggest possible benefits and risks of using genetic modification to develop varieties of crop plant with traits such as drought resistance.

(Question 1 continued)

A similar study compared the effect of a different neonicotinoid on four different species of bumblebees. The queens were exposed to either control conditions (with no pesticide), or low or high doses of neonicotinoid. The scientists then measured the average length of the developing eggs in the ovaries of the queens.

[Source: adapted from Baron, G.L., Raine, N.E. and Brown, M.J.F., 2017. Proceedings of the Royal Society B, [e-journal] https://doi.org/10.1098/rspb.2017.0123. REFERENCE REDACTED.]

(c)	(i)	Identify the species whose eggs are most affected by a high dose
		of neonicotinoid.

[1]

				_
	STATE AND STREET AND	\$20 9 60 P P P P P P P P P P P P P P P P P P		

Describe the overall effects of low and high doses of neonicotinoid on the egg lengths of all four species.
